

PAPIL-DERMA®

GEL

PREVENTION AND ADJUVANT TREATMENT OF HPV MICROLESIONS

CE Medical Device
Class 1
Directive 93/42/EEC

PRODUCT CLASSIFICATION:

European Medical Device CE Class I.

ACTIVE INGREDIENTS:

- Colloidal Silver
- Citric acid

HOW TO USE:

For external use: Open the tube and apply a strip of cream directly to the genital and/or peri-anal area as needed.

INDICATIONS:

For the treatment of HPV-derived condylomas on female and male genitals organs.

PACKAGING:

20 ml in a plastic laminated tube inserted in a fold box with leaflet.

COLLOIDAL SILVER:

Colloidal Silver atoms interact with the metabolism of the HPV virus and limit its ability to replicate, despite the leathery nature of condylomas, which are not an easy target.

CITRIC ACID:

Citric Acid creates a hostile environment for the growth of micro-organisms due to its acidic pH, promoting a disinfectant action for external use, alleviates pain and discomfort caused by the lesion and exerts a mild dehydrating action by promoting the drying process of condylomas.
